

Protocol number: BK-JM-201

Is dyskinesia with Parkinson's disease keeping you from moving forward?

The SHINE clinical study may help put research in motion.

Now enrolling: The SHINE study is researching moderate to severe dyskinesia in patients taking levodopa for Parkinson's disease (PD).

The SHINE clinical study needs volunteers with Parkinson's disease. Study doctors want to learn if an investigational drug may help control your dyskinesia symptoms while taking levodopa.

If you qualify:

- Participation may last up to 11 weeks for study Part 1 and 20 weeks for study Part 2
- You will receive the study drug in the form of a tablet that you'll take with levodopa
- You will be monitored throughout the study as your health is very important to us

To be eligible for this study, you must:

- Be 18 to 85 years of age
- Be diagnosed with Parkinson's disease (PD) and taking a stable dose of levodopa 3 to 6 times daily
- Have muscle twitches and twisting movement (dyskinesia) that is moderately to completely disabling (more than one hour per day)

The study staff will also check other requirements to confirm that you qualify.

Ask your doctor if you are eligible for the SHINE study.
